SUMMARY

The Reedy Meadow Swamp Mitigation Site is located in Bladen County. The site was designed as a wetland mitigation site in the Lumber River Basin for impacts associated with R-2562.

The mitigation encompasses approximately 0.27 acres total of wetland restoration. The restoration effort involved removing the existing culvert at site 7, Section C and constructing a 210 foot long bridge, thereby restoring 0.27 acres of riverine marsh wetlands in the Lumber River Basin. Hydrologic monitoring is not required for this project; however vegetation monitoring is required for one year.

After the first year of monitoring, the Reedy Meadow Swamp Mitigation Site shows by visual observation that the site is re-vegetating in the wetland restoration area and is re-attaining wetland jurisdictional status.

NCDOT proposes to continue vegetation monitoring of this site.

1.0 INTRODUCTION

1.1 Project Description

The Reedy Meadow Swamp Mitigation Site is located on NC 87 in Bladen Co. The site consists of approximately 0.27 acres of mitigation for wetland impacts associated with project R-2562.

1.2 Purpose

In order for a mitigation site to be considered successful, the site must meet the vegetation success criteria. This report details the vegetation monitoring in 2008 at the Reedy Meadow Swamp Mitigation Site. Hydrologic monitoring was not required for the site.

1.3 Project History

March 2008	Highway Project Completed
July 2008	Vegetation Monitoring (1 year)

2.0 VEGETATION: REEDY MEADOW SWAMP MITIGATION SITE (YEAR 1 MONITORING)

2.1 Success Criteria

The permittee shall photo monitor the mitigation site for one year following completion of the highway project. Success shall be determined by comparing vegetation and hydrology in the restored site with the adjacent undisturbed wetland. If after one year the hydrology and vegetation do not mimic the reference site, remediation may be necessary and monitoring of the mitigation site extended.

2.2 Description of Species

The area was seeded and mulched. There were no bareroot seedlings planted.

2.3 Results of Vegetation Monitoring

The area that was restored has re-vegetated with black willow, alder, red maple, bays, cattails, briars, *Juncus* sp., fern, fennel, goldenrod, woolgrass, lespedeza, poplar, pokeberry, and various wetland species.

2.4 Conclusions

There were approximately 0.27 acres total of wetland restoration on site. There were no plots established on the site. By visual observation, the Reedy Meadow Swamp Site shows that the restored area is re-vegetating and that the area is re-attaining wetland jurisdictional status.

3.0 OVERALL CONCLUSIONS AND RECOMMENDATIONS

NCDOT proposes to continue vegetation monitoring at the Reedy Meadow Swamp Mitigation Site.
